EXAMPLE NOTE DOCUMENT

AUTHOR

Abstract. This short note showcases the note template: theorem-like environments, theorem-numbered lists, ordinary enumerated lists, displayed equations, commutative diagrams, citations, URLs, and cross-references.

1. Objects and diagrams

Definition 1.1. A *good object* is an object X together with a morphism

$$\eta_X \colon X \to F(X)$$

satisfying the following conditions. ⚠ A draft note here.

(a) The assignment $X \mapsto \eta_X$ is functorial in X.
(b) The morphism η_X is compatible with base change.

The numbering in Items 1.1(a) and 1.1(b) is derived from the surrounding theorem-like environment Theorem 1.1. This is useful for statements with several numbered conditions.
Alice: We should add an example here.

Example 1.2. A basic diagrammatic situation is a commutative square

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ {\scriptstyle f'}\downarrow & & \downarrow{\scriptstyle f} \\ Y' & \xrightarrow[g]{} & Y. \end{array}$$

The command `tikz-cd` is available in this template for diagrams of this kind.

Bob: I've added the example above.

Date: 1st November 2026.

Lemma 1.3. *In the situation of Theorem 1.2, suppose that the square is cartesian. Then the compatibility condition in Item 1.1(b) can be expressed by the identity*

$$g^* f_* \simeq f'_* g'^*. \tag{1.1}$$

Proof. This is only a template proof. The displayed formula illustrates a typical mathematical display, while the reference to Item 1.1(b) illustrates a theorem-numbered item reference. □

2. References and ordinary lists

The template uses biblatex. For example, one may cite Hartshorne's textbook [Har77] or the Stacks Project [SP].

Ordinary lists remain ordinary. For instance:

(a) This is a first ordinary item.
(b) This is a second ordinary item.

Thus Item (b) is an ordinary item reference, whereas Item 1.1(b) is a theorem-numbered item reference.

Proposition 2.1. *Let X be a good object. If the square in Theorem 1.2 is cartesian, then X' inherits the corresponding compatibility property.*

Proof. The assertion follows formally from Theorem 1.3 and Item 1.1(b). **Bob:** Maybe we should add more details here. □

Remark 2.2. Hyperlinks can be written using `\href`. For example, the template repository could link to the tikz-cd package page. URLs inherit the hyperlink colour configured in the common preamble.
