Chapter 1

A Sample Chapter

1.1 Structured statements

Definition 1.1.1. A *longform object* is an object X equipped with a map

$$\alpha_X : X \to G(X)$$

satisfying the following properties. ⚠ Here is a to-do note.

(a) The object X exists in the category under consideration.

(b) It is unique up to unique isomorphism.

Proposition 1.1.2. *Every longform object is determined by the data in Items 1.1.1(a) and 1.1.1(b).*

Proof. This is a template proof. The point is that the item references are attached to the theorem-like environment Theorem 1.1.1, so their labels are numbered using the surrounding theorem number. □

Remark 1.1.3. Long-form documents often contain many references. **Alice:** Alice's comment here. **Bob:** Bob's reply here. This example cites Hartshorne [Har77] and the Stacks Project [SP].

1.2 Diagrams and ordinary lists

The template supports commutative diagrams. For instance, one may write

$$\begin{array}{ccc} A & \xrightarrow{\phi} & B \\ {\scriptstyle\alpha}\downarrow & & \downarrow{\scriptstyle\beta} \\ C & \xrightarrow[\psi]{} & D. \end{array}$$

Such diagrams are useful in lecture notes and book-length projects.

The template also supports ordinary enumerated lists:

(a) A first ordinary item.

(b) A second ordinary item.

We can refer to Item (b) as an ordinary item, and to Item 1.1.1(b) as a theorem-numbered item.

Chapter 2

Another Chapter

2.1 Resetting theorem numbers

This chapter checks that theorem-like numbering behaves correctly after a chapter change.

Lemma 2.1.1. *The references from the first chapter, such as Theorem 1.1.1, still work from later chapters.*

Proof. This proof is only illustrative. It also demonstrates a displayed equation:

$$(f \circ g)^* = g^* \circ f^*. \tag{2.1.1}$$

□

Example 2.1.2. A long-form document may also contain external links, for instance to the biblatex package page.
